

Alex's Active Anatomy

MED 801 Reasoning Lab - v60 How-to-Use Guide

Start here: Set Practice Region to **Mixed / automatic** and Practice System to **Mixed / all**. Choose a learning mode, then narrow the scope only when you want focused practice.

1. Navigating the site

Use the **Learning Mode** buttons on the left to choose how you want to study. Use the **Table of Contents** to jump directly to a body region or focused anatomy section. When you choose a Table of Contents item, allow the new map/question to load before clicking another control.

Mode	How to use it
Level 1 - Anatomical Mapping	Choose a region/system. Read the target and click the matching structure on the map. Use Labels On for review or Guess Mode for active recall.
Level 2 - Integrated Anatomy	Turn system overlays on/off to study how structures from different systems occupy the same region and interact. Use the mnemonic/anchor only when you want a cue.
Level 3 - Free Recall	Read the prompt, mentally or verbally reconstruct the answer, then select Reveal Reasoning. Advance when ready.
Clinical Exam - Locate	Use Locate Quiz to read an examination prompt and click the correct body landmark. Use Explore Landmarks to click any marker and learn its name, location, and clinical importance.
Level 4 - Applied Surface Anatomy	Answer single-best-answer clinical/spatial vignettes. Use Hint or Reveal Answer if needed, then manually advance.
Joints & Articulations	Review the joint-category reference diagrams and definitions, then answer the Check Your Understanding questions on the right.

2. Using Practice Scope

Practice Region controls where questions come from. **Practice System** controls which anatomical system is emphasized. You can combine them for focused study - for example, Upper Limb/Axilla + Cardiovascular, or Thorax + Respiratory.

If a focused combination produces very few targets, return one or both filters to **Mixed**. When you change a filter, the Level 1 target queue resets so the next questions follow the new scope.

3. Level 1 map controls

Labels On: displays structure names for guided review. **Guess Mode:** removes labels. **Highlight Target:** visually identifies the requested structure. **Hint:** provides a cue. **Reveal Answer:** shows the answer without automatically moving to the next target. Use Anterior/Posterior controls where available.

4. Clinical Exam - Locate

In **Locate Quiz**, read the clinical examination instruction and click the surface marker you would use on a patient. Wrong selections remain retryable. Use **Reveal Site** if you are stuck.

In **Explore Landmarks**, click any marker to see its label, anatomical location, and why that site matters during the examination. Switch between **Anterior** and **Posterior**. Select **Show Internal Anatomy** to expose the simplified structures beneath the surface landmarks.

The clinical map includes course-relevant cardiac/pulmonary landmarks, lymph-node regions, upper-limb blood-pressure and pulse landmarks, and lower-extremity pulse/lymphatic regions.

Alex's Active Anatomy

Quick controls and study workflow

5. Terminology practice

Use the Table of Contents to select **Terminology Mixed**, **Planes & Sections**, **Relationships**, **Surfaces & Sidedness**, or **Movements**. The question and answer choices should change together when you change the terminology category.

6. Detailed anatomy sections

Use the Table of Contents for focused closeups such as Heart, Lungs, Shoulder/Scapula, Arm/Hand, Pelvis/Hip, Foot/Ankle, Bone Atlas, Vertebral Column, Thoracic Levels, Fasciae, and Joints. Some sections are interactive maps; others are reference-plus-question sections.

7. Using hints, answers, and mnemonics

Hints and answers never need to advance the question automatically. After reviewing feedback, select the appropriate Next button when you are ready. Mnemonics/anchors are supplemental and remain hidden until you intentionally select the mnemonic/anchor control or open the mnemonic reference section.

8. Suggested study sequence

Step	Suggested use
1	Start Level 1 with labels visible to orient yourself.
2	Turn on Guess Mode and repeat the same region without labels.
3	Use Integrated Anatomy to overlay systems and study relationships.
4	Use Clinical Exam - Locate to connect internal anatomy to examination landmarks.
5	Use Level 4 to apply the spatial relationships in clinical-style scenarios.
6	Use Free Recall and mnemonics for retrieval after you have mapped the anatomy.

9. If something appears out of scope

Return Practice Region and Practice System to **Mixed**, then re-enter the section you want. Narrow one filter at a time. If the browser is displaying an older cached copy of the site, perform a hard refresh: **Ctrl+Shift+R** on Windows or **Cmd+Shift+R** on macOS.
